Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              specifically cleaves, or inhibits expression of, Hairless Protein mRNA which comprises a catalytic domain that cleaves mRNA at a defined consensus sequence and binding domains contiguous with the 5' and 3' ends of the catalytic domain. Lack of expression of the hairless gene due to inherited mutations leads to the complete loss of hair, known as atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have
                                                        13-APR-2001; 2001US-283618P.

```
CC which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC inherited mutations leads to the complete loss of hair, known as a trichia. Abundant hair growth, hirsutism, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology. CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have core lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing thair removal products which function by inhibiting hairless protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New catalytic nucleic acid molecule that specifically cleaves Hairless protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
Sequence 29 BP; 7 A; 9 C; 10 G; 3 T; 0 other;
                                                   expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 1597.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention discloses a new catalytic DNA or RNA molecule that specifically cleaves, or inhibits expression of, Hairless Protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 3; Page 34; 65pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 27
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC of the catalytic domain. Lack of expression of the hairless gene due to conherited mutations leads to the complete loss of hair, known as cc atrichia. Abundant hair growth, hisuitism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gree suppression is through the use of catalytic nucleic acid technology, c including ribozymes and DNAzymes. Ribozymes are RNA structures which have a sali-catalytic enzymatic function and sequence specific RNA binding c ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a ccatalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen c phase. A non-human transgenic mammal is useful as a model for testing c expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 1641.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC specifically cleaves, or inhibits expression of, Hairless Protein mRNA CC which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC inherited mutations leads to the complete loss of hair, known as CC inherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsuitism, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology. CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have CC a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the CC hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have CC degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids of are useful in pharmaceutrical compositions for inhibiting hair productions.

A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 1698.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
                               Deoxy-ribozyme, cleaving hairless protein mRNA after nucleotide 1732
                                                                     25-FEB-2003

Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmacutical compositions for inhibiting heavy muchantics.

                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                    are useful in pharmaceutical compositions for inhibiting hair production by a hair-producting cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 1732.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      specifically cleaves, or inhibits expression of, Hairless Protein mRNA which comprises a catalytic domain that cleaves mRNA at a defined consensus sequence and binding domains contiguous with the 5' and 3' ends
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       hair loss; atrichia; hair growth; hirsutism; catalytic nucleic acid; ribozyme; DNAzyme; self-catalytic; hammerhead ribozyme; decay-ribozyme; catalytic core; cleavage site; pharmaceutical; hair production; hair follicle; anagen phase; catagen phase; hair removal product;

Consensus sequence and binding domains contiguous with the 5' and 3' ends continents to the catalytic domain. Lack of expression of the hairless gene due to Cinherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have commended, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair growth and for inhibiting base. A non-human transgenic mammal is useful as a model for testing the transition of a hair follicle from the anagen phase to the catagen caphase. A non-human transgenic mammal is useful as a model for testing thair removal products which function by inhibiting hairless protein caphase. A non-human transgenic mammal is useful as a model for testing thair removal products which function by inhibiting hairless protein caphase. The deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 1750.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Catalytic DNA; catalytic RNA; hairless protein; 88; hair loss; atrichia; hair growth; hisutism; catalytic nucleic acid; ribozyme; DNAzyme; self-catalytic; hammerhead ribozyme; deoxy-ribozyme; catalytic core; cleavage site; pharmaceutical; hair production; hair follicle; anagen phase; catagen phase; hair removal product;

       The invention discloses a new catalytic DNA or RNA molecule that C specifically cleaves, or inhibits expression of, Hairless Protein mRNA c which comprises a catalytic domain that cleaves mRNA at a defined consensus sequence and binding domains contiguous with the 5 and 3 ends c of the catalytic domain. Lack of expression of the hairless gene due to c inherited mutations leads to the complete loss of hair, known as c atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient c gene suppression is through the use of catalytic nucleic acid technology, c including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding c ability. Small DNA oligonuclectides that have a similar structure to the catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producting cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen c phase. A non-human transgenic mammal is useful as a model for testing thair removal products which function by inhibiting hairless protein
                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 3; Page 34; 65pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SXS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Best Lo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                      specifically cleaves, or inhibits expression of Hairless Protein mRNA which comprises a catalytic domain that cleaves mRNA at a defined consensus sequence and binding domains contiguous with the 5' and 3' ends of the catalytic domain. Lack of expression of the hairless gene due to inherited mutations leads to the complete loss of hair, known as atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, translent gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and NNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding ability. Small DNA oligonucleotides that have a similar structure to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Catalytic DNA; catalytic RNA; hairless protein; 88; hair loss; atrichia; hair growth; hirsutism; catalytic nucleic acid; ribozyme; DNAzyme; self-catalytic; hammerhead ribozyme; deoxy-ribozyme; catalytic core; cleavage site; pharmaceutical; hair production; hair follicle; anagen phase; catagen phase; hair removal product;
                                                                                                                                                                                                                                                                        New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase

            The invention discloses a new catalytic DNA or RNA molecule that specifically cleaves, or inhibits expression of, Hairless Protein mRN which comprises a catalytic domain that cleaves mRNA at a defined consensus sequence and binding domains contiguous with the 5' and 3' of the catalytic domain. Lack of expression of the hairless gene due
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 1811.
                                                                                                                                                                New catalytic nucleic acid molecule that specifically cleaves Hairless protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC the genes promoting hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have CC ability. Small DNA oligonucleotides that have a similar structure to the CC hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to CC degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen CC phase. A non-human transgenic mammal is useful as a model for testing CC hair removal products which function by inhibiting hairless protein CC expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 2028.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best Local Similarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                            New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           hair loss; atrichia; hair growth; hirsutism; catalytic nucleic acid; ribozyme; bnazyme; self-catalytic; hammerhead ribozyme; decay-ribozy; catalytic core; cleavage site; pharmaceutical; hair production; hair follicle; anagen phase; catagen phase; hair removal product;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABX13997 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

consensus sequence and binding domains contiguous with the 5' and 3' ends of the catalytic domain. Lack of expression of the hairless gene due to inherited mutations leads to the complete loss of hair, known as inhibiting atrichia. Abundant hair growth, hirsuitism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in nharmacantical components of the interticulations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 2033.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          specifically cleaves,

Sequence 29

New catalytic nucleic acid molecule that specifically cleaves Hairless protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase to catagen phase

Claim 3; Page 35; 65pp; English

Consensus sequence and binding domains contiguous with the 5' and 3' ends co f the catalytic domain. Lack of expression of the hairless gene due to conherited mutations leads to the complete loss of hair, known as catalytic bundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient concluding ribozymes and DNAzymes are RNA structures which have including ribozymes and DNAzymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding catalytic core and two sequence specific arms. The doxy-ribozymes having a contralytic core and two sequence specific arms. The doxy-ribozymes have contralytic consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair folicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing thair removal products which function by inhibiting hairless protein the carnoval products which function by inhibiting hair less protein The invention discloses a new catalytic DNA or RNA molecule that specifically cleaves, or inhibits expression of, Hairless Protei which comprises a catalytic domain that cleaves mRNA at a define ssion. The sequence presented is the deoxy-ribozyme that cleaves the hairless protein mRNA immediately after nucleotide 2047. Protein mRNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC of the catalytic domain. Lack of expression of the hairless gene due to conherited mutations leads to the complete loss of hair, known as catalytic domain hair growth, hirsuitsm, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding cability. Small DNA oligonucleotides that have a similar structure to the chammerhead ribozyme, called deoxy-ribozymes are DNAzymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have come lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen chair removal products which function by inhibiting hairless protein the expression. The sequence presented is the deoxy-ribozyme that cleaves the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

CC specifically cleaves, or inhibite expression of, Hairless Protein mRNA CC which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5' and 3' ends of the hairless gene due to of the catalytic domain. Lack of expression of the hairless gene due to CC inherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsuitsm, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, that have a similar structure to the catalytic core and two sequence specific arms. The deoxy-ribozymes have care useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting that growth and for inhibiting care expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 2380.
  New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase

                                                                                                                                                                which comprises a catalytic domain that cleaves mRNA at a defined of the catalytic domain that cleaves mRNA at a defined consensus sequence and binding domains contiguous with the 5' and 3' ends of the catalytic domain. Lack of expression of the hairless gene due to of the catalytic domain beach of the complete loss of hair, known as atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, translent gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding a billity. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids catalytic core and teally for inhibiting for inhibiting hair production by a hair-production cell, for inhibiting hair growth and for inhibiting hair production by a hair products which function by inhibiting hairless protein mRNA immediately after nucleotide 2395. human hairless protein mRNA immediately after nucleotide 2395.

                                                                                                                                                       CC gene, and a sequence of interest which produces a RNA template from the reverse transcriptase synthesises cDNA of a specified sequence. CC which the reverse transcriptase synthesises cDNA of a specified sequence. CC taking advantage of the stem-loop structure of the cDNA, which forms as CC a result of the inclusion of a inverted tandem repeat that allows the scDNA to fold back on itself, forming a double stranded DNA stem, in CC sequence of interest. The double-stranded stem contains one or more the sequence of interest. The double-stranded stem contains one or more for delivery to a cell. The vectors are is useful for producing a ssDNA cC sequence of interest, particularly a cDNA transcript, an inhibitory concleic acid molecule which is an antisense sequence or aptamer, an mENA cc transcript and a heteroduplex molecule. Inhibitory nucleic acid molecules to a target cell are useful for alleviating pathological conditions by regulating gene expression. The present oligonucleotide was used to produce a vector for use in the course of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention provides novel modified ribozymes that have 3 or more pyrimidine nucleotides (PMM) in the ribozyme modified at the 2'-position, CC where the PMNs are modified to 2'-amino PMNs and the ribozymes exhibit improved stability to RNAase degradation and exhibits 85% or more CC improved stability to RNAase degradation and exhibits 85% or more CC invention are selected from rat and human protein kinase C (PKC) alpha CC ribozymes, tumour necrosis factor (TMP) alpha ribozyme, rat and human CC vascular epithelial growth factor (VEGP) ribozymes. These ribozymes can CC be used for treating or preventing a disease or condition responsive to CC an alteration in the expression of a gene, where the ribozyme is capable of cleaving the RNA transcribed from the gene. They can be used for treating or preventing a disease or condition associated with the CC proiliferation of rapidly dividing cells, e.g. cancer such as malignant CC means. They can also be used for inhibiting the proliferation of cells. The use of 2'-amino modified pyrimidine can provide ribozyme of improved Stability which retain the activity of the unmodified ribozyme. The

target cell produces an RNA template which is reverse transcribed to produce ss-cDNA of a specified sequence. The ss-cDNA folds back on itself as a result of the inverted tandem repeat, to form a stem-loop structure. The loop is comprised of the sequence of interest. The cDNA transcript is bound to an endogenous nucleic acid target to alter expression of the target sequence. This method is useful for altering the expression of gene products e.g. c-myc or a viral gene product. It may be applied to gene therapy, with target genes mutated or introduced for therapeutic purposes, such as gene inactivation using duplex or triplex binding of nucleic acids, site-directed mutagenesis, interruption of cellular function by binding to specific cellular proteins and interfering with
                                                                                                                                                                                                                                                                       The sequence represents a synthetic single stranded cDNA. This DNA in a target cell and is transfected with a cassette comprising a rof interest flanked by inverted trandem repeats (ITR) and a primer site (PBS) 3' to the tandem repeat. Transcription of the cassette

                                                                                                                                                                                                                                                                                                                                                                                                                  US-09-536-393-19
              Sequence 20, Application US/09536393

Patent No. 6522570

GENERAL INFORMATION:
APPLICANT: Rosel, John J.
APPLICANT: Scherr, Michaela
APPLICANT: Riggs, Arthur D.
TITLE OF INVENTION: Method for Identifying Accessible Binding Sites on
FILE REPERENCE: 1954-285

FILE REPERENCE: 1954-285
